### **EE/CPRE 294: Portfolio Project Assignment**

Identify one to two projects that you would like to include in your portfolio. Write a summary of those projects in terms that someone with no engineering background can understand. Use the following questions to structure your summary:

- a) Identify the project.
- b) Describe the project: What is it about? What was the goal?
- c) Identify skills acquired during the project: What was your contribution to the project? What did you learn in terms of new skills?
- d) What importance/application might this project have in the larger world outside your classroom?

I would like to make a chat bot that can answer questions about myself and my resume. I would put it on my website as type of assistant. The project would allow visitors to my website to clarify get an answer to any questions they may have in the moment. My contribution to the project would be making the bot and the website. The website would feature my other projects, skills, resume, contacts, and whatever other information I choose to include. As far as new skills go, I would learn how to make a website and an interactive updating chatbot. Both of which I have been meaning to learn. Outside of the classroom this would be useful for web development. Many websites are utilizing automated chat services to assist customers. Later I could apply this to a job managing one of those chat systems.
